AvePoint Privacy Impact Assessment System

The AvePoint Privacy Impact Assessment System (APIA), distributed to the global privacy community exclusively by the International Association of Privacy Professionals (IAPP), is a technology solution that mitigates the risk inherent with manual privacy impact assessments, helping organizations to better protect personally identifiable information. APIA helps enterprises understand and automate the process of evaluating, assessing, and reporting on the privacy implications of their enterprise IT systems.

○ Comply with Privacy Regulations
Analyze how personal information is handled by enterprise IT systems to comply with global privacy legislation-mandated privacy impact assessments (PIA).

○ Automate Privacy Impact Assessments
Utilize APIA's form based survey system, built-in workflows as well as configurable questions and answers to simplify the way privacy, security, IT, and business owners interact and communicate during PIAs.

○ Report on PIAs for Stakeholder Review
Automatically generate organization-specific PIA reports to distribute to Chief Privacy Officers for review.

○ Extend to Security and Vulnerability Assessments
Extend and customize APIA for security and vulnerability assessments as well as requirements from other quality assurance and/or records management review.
